Web Design Workflow:

7-Step Guide
This guide outlines a structured workflow from design template creation to deployment. Each step specifies tools, inputs, outputs, and key considerations to ensure a smooth, auditable build.

Step

1: Creating Design Template

- Tools: Google Stitch, Sheets/Notion, Drive/Dropbox
- Inputs: Google reviews, site screenshots, live URL, brand description, existing assets (logos, colors, typography)
- Actions:
  - Collect: Export reviews (CSV), capture annotated screenshots, archive current site, gather brand guidelines.
  - Organize: /01_Discovery (reviews.csv, screenshots/), /02_DesignSystem, /assets/brand (logo PNGs/SVGs, color refs).
  - Build Stitch Design System: colors (tokens + accessibility ratios), type scale, spacing grid, components (nav, buttons, cards, forms), iconography, motion tokens (durations/easing), content styles.
- Output: Stitch design system + discovery library
- Considerations: Accessibility (WCAG AA), mobile-first tokens, naming conventions (BEM/tokens)

Step

2: Page Architecture

- Tools: GPT or Gemini, Google Stitch
- Inputs: Research findings and stakeholder requirements
- Actions:
  - Define IA: pages, sections, content blocks, CTAs, SEO targets.
  - Prompt Structure for Stitch: goals, audience, tone, page list, section specs (inputs, outputs, acceptance criteria), component mapping to design system.
- Output: Architecture .md in /03_Architecture with Stitch-ready prompts
- Considerations: Map each section to measurable outcomes; plan responsive breakpoints

Step

3: Page Animations & Features

- Tools: Gemini, 21st dev animation references, Google Stitch
- Actions:
  - Brainstorm: Identify purpose of each animation (attention, guidance, delight).
  - Placement Plan: Annotate architecture with theoretical animation slots (not generated in Stitch).
  - Reference: Link to example animations per section.
- Output: /04_AnimPlan annotated architecture with links

- Considerations: Performance budgets, prefers-reduced-motion fallbacks

Step

4: Animation Video Generation

- Tools: Gemini, Higgsfield, Open Gen AI
- Actions:
    - Generate high FPS previews (webm/mp4, webp/png sequences).

  File naming: page_section_variant_v1.ext; store in /assets/animations and /assets/images;
    - include logo PNGs/SVGs.
    - Prepare delivery: Transcoded web formats, transparent backgrounds if needed.
- Output: Organized asset library with preview sheet
- Considerations: Size targets (<2MB hero video), aspect ratios, licensing

Step

5: Final Check Overs

- Tools: AI reviewer (GPT/Gemini), linters, accessibility checker
- Checklist:
    - Design system complete; all pages architected; animations planned; assets organized.
    - Create /CHECKLIST.md with acceptance criteria per page.
    - Run AI review on .md and assets for gaps.
- Output: Signed checklist, fix list
- Considerations: Internationalization, SEO metadata plan

Step

6: Layer by Layer Build

- Tools: Claude Code, Stitch MCP, local dev
- Actions:
    - Review .md; build blank wireframes; implement landing/hero first.

  Add
    - 3D/animations under semantic structure; test; iterate with user.
    - Ensure Claude reads Stitch MCP; self-audits against acceptance criteria.
    - Repeat per page.
- Output: Incremental PRs per page
- Considerations: Component reuse, performance audits per iteration

Step

7: Refinements & Deployment

- Tools: Partner reviews, AIs, Vercel
- Actions:
    - Stakeholder QA, UAT, accessibility and cross-browser checks.

    - Final polish (copy, spacing, motion intensity).
    - Deploy to Vercel; set env vars, domains, previews; post-deploy checks.
- Output: Live site + release notes
- Considerations: Rollback plan, monitoring, analytics setup
